

CSCI 132: Basic Data Structures and Algorithms

Final Study Guide

Logistics

- Monday, May 8th @ **2:00 PM – 3:50 PM** in Norm Asbjornson Hall 165
- Time length: 110 minutes. This exam is designed to be completed in 60-75 minutes.
- Open notes. You are allowed to use your laptop, your IDE, any notes, slides, lecture examples. This exam can be completed without a laptop.
- You are NOT allowed to use the internet to access external resources (Google, Stack Overflow, W3 Schools, etc)
- The midterm exam will consist of different types of question, such as:
 - Multiple choice questions
 - True/False
 - Short answer
 - Illustrate the steps of ____ sort
 - What does the stack/queue look like after X operations?
 - Complete the line of code so that X happens.
 - What does this (recursive) method do?

Content

The following topics are all fair game for the midterm exam.

- Basic Java Classes, Class Structure, Methods, Operations, if statements, loops, OOP
- Basic Linked Lists
- Big-O Notation, How to determine running time of an algorithm
- Stacks
- Queues
- Bubble Sort
- Selection Sort
- Merge Sort
- Quick Sort
- Linear Search/Binary Search
- Recursion

Sample Exam Questions

1. What is the running time of adding a new element to a stack?
 - a. $O(1)$
 - b. $O(N)$
 - c. $O(N^2)$
 - d. $O(\log n)$
2. How does Merge Sort achieve $O(n \log n)$ running time?
3. True/False: The Binary Search algorithm only works on a sorted dataset.

4. Consider the following code:

```
Queue<String> queue = new LinkedList<String>();  
queue.add("Blue");  
queue.add("Red");  
queue.add("Yellow");  
System.out.println(queue.remove());  
queue.add("Green");  
queue.add("Purple");  
System.out.println(queue.peek());  
queue.remove();  
queue.add("Orange");  
System.out.println(queue.remove());
```

- I. What is the output of the code above?

- II. What is the running time of the code above?

- III. Illustrate the current contents of the Queue after the code finishes.

Front of queue

Back of Queue

5. Given the following unsorted array:

10	6	21	14	1	3	5
----	---	----	----	---	---	---

Suppose you are running **selection sort** to sort this array of integers. Selection sort consists of several iterations across the array. Illustrate the steps of selection sort for each iteration until the array is sorted

Iteration 1

--	--	--	--	--	--	--

Iteration 2

--	--	--	--	--	--	--

Iteration 3

--	--	--	--	--	--	--

Iteration 4

--	--	--	--	--	--	--

Iteration 5

--	--	--	--	--	--	--

Iteration 6

--	--	--	--	--	--	--

Iteration 7

--	--	--	--	--	--	--

6. The table below lists the big-O running times of certain operations. Fill in the missing spots of the table with the correct running time.

Linear Search	
Quick Sort	$O(n^2)$
Binary Search	
Popping an element from the Stack	
Printing out a linked list using recursion	$O(n)$

7. Suppose you want to create your own Stack data structure class, but you need to decide if you should use an Array or a Linked List. In general, when should you use an array vs a LinkedList as an underlying data structure for a stack?

8. What is a stack overflow?

9. True/False: It doesn't matter what sorting algorithm I use; they all do the same thing in the end.
