

# CSCI 466: Networks

Network Security (Message Confidentiality)

Reese Pearsall  
Fall 2024

## Announcements

- Wireshark Lab 3 due **tonight**
- PA3 posted. Due Sunday November 3<sup>rd</sup>
- You can see the questions you got wrong on quizzes
- Class registration begins this week

## Programming Assignment 4

## Wireshark Lab 4

# Goal:

Two parties (Bob) and (Alice) want to communicate **securely**

## Principles of **secure communication**

1. **Confidentiality** – only the sender and receiver should be able to understand the contents of the transmitted message
2. **Message Integrity** – the contents of the message have not been altered (maliciously or by accident)
3. **Authentication** – Both the sender and receiver should be able to confirm the identity of the other party involved in communication
4. **Authorization**- Should a user be allowed to do such action?

---

**Operational Security**- Infrastructure to help prevent hosts/networks from getting compromised (Firewalls, VPNs, etc)

### **Confidentiality**

Data is kept private, secret, and secure, only to be accessed by specific parties.

### **Integrity**

Data and the security around it is consistent, accurate, and reliable.

### **Availability**

Systems and applications remain available unless compromised in an attack.

# Principles of Cryptography

**Goal:** Only the sender and intended receiver should be able to understand the contents of a transmitted message (confidentiality), so sender must find a way to **encrypt** his message

(Trudy could steal information, modify information, or **spoof** her own message)

# Symmetric Key Cryptography

**Symmetric Key Cryptography** is a type of encryption where only one key (a secret key) is used to both encrypt and decrypt electronic information

# Early Symmetric Key Cryptography

**Caesar Cipher-** Each letter in plaintext is replaced by a letter some *fixed number* of positions down the alphabet

**Brown Laz****y** **Fo****x** → **Eur****z****q** **Od****c****b** **I****r****a**

If you did not know the key,  
how difficult would it be to  
crack a Caesar cipher?

# Early Symmetric Key Cryptography

## Monolithic Substitution

**Cipher-** each letter of the plain text is replaced with another letter of the alphabet (no fixed length position)

What does a key look like?

26-Characters

“EABZTIVGSKXFJPYCDWONMHQLRU”

If we don't know the key, how difficult would it be to **brute force** this?

# Early Symmetric Key Cryptography

## Monolithic Substitution

**Cipher-** each letter of the plain text is replaced with another letter of the alphabet (no fixed length position)

What does a key look like?

26-Characters

“EABZTIVGSKXFJPYCDWONMHQLRU”

If we don't know the key, how difficult would it be to **brute force** this?

**26!** Possible permutations

However, we can leverage the fact that certain characters appear more commonly in the English language (a, e, i, t, r) to make guessing *much* easier  
(**frequency analysis**)

# Block Cipher

Plaintext is divided into n-sized blocks and each block is encrypted independently

3-bit Block Cipher Table

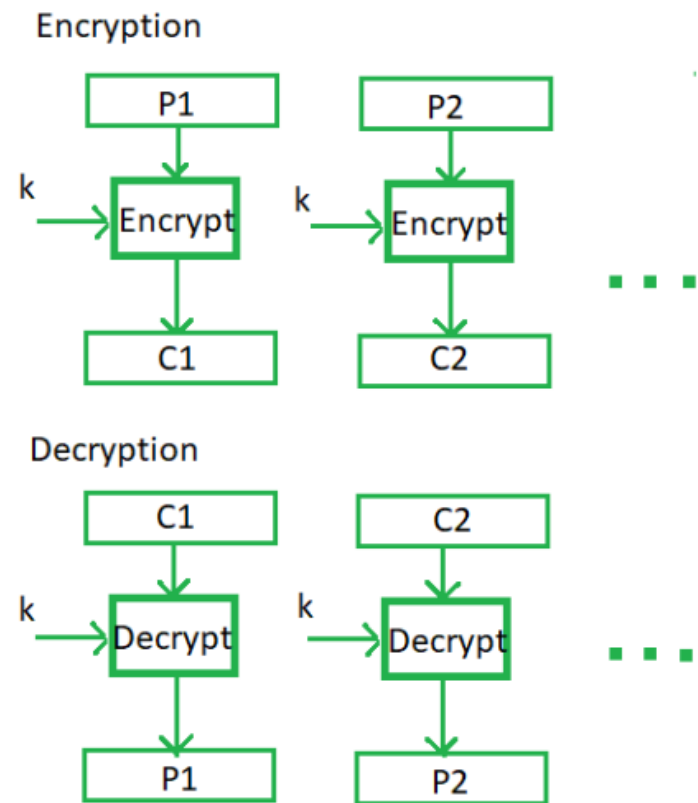

| Input | output |
|-------|--------|
| 000   | 110    |
| 001   | 111    |
| 010   | 101    |
| 011   | 100    |
| 100   | 011    |
| 101   | 010    |
| 110   | 000    |
| 111   | 001    |

Key!

010000111→

# Block Cipher

Plaintext is divided into n-sized blocks and each block is encrypted independently

3-bit Block Cipher Table

| Input | output |
|-------|--------|
| 000   | 110    |
| 001   | 111    |
| 010   | 101    |
| 011   | 100    |
| 100   | 011    |
| 101   | 010    |
| 110   | 000    |
| 111   | 001    |

Key!

010000111 → 101110001

# Block Cipher

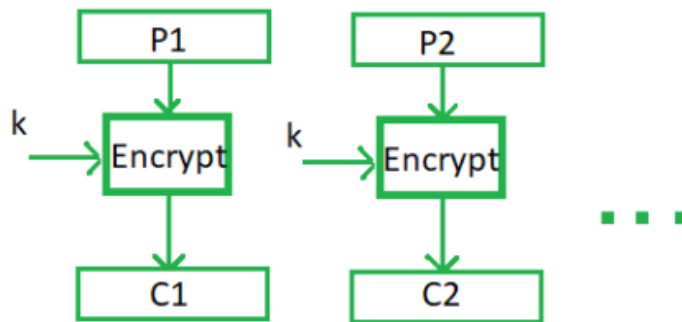

Plaintext is divided into n-sized blocks and each block is encrypted independently

010000111 → 101110001

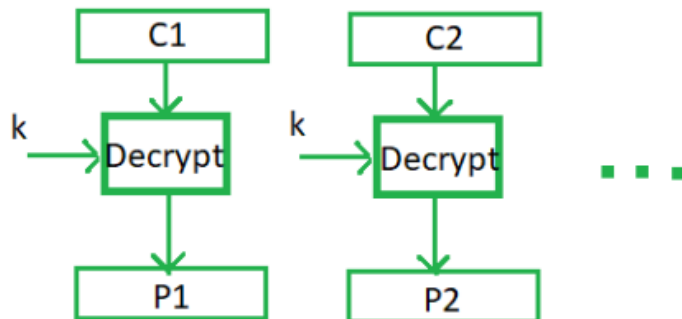

Typically, the block sizes are going to be 64 bits or even larger

# of mappings  
general formula:  $2^k$ !

Encryption

Decryption

Important Properties

- Even small differences in plaintext result in different ciphertexts
- Blocks in plaintext that are the same will also have matching ciphertexts

# Block Cipher

- Even small differences in plaintext result in different ciphertexts
- Blocks in plaintext that are the same will also have matching ciphertexts

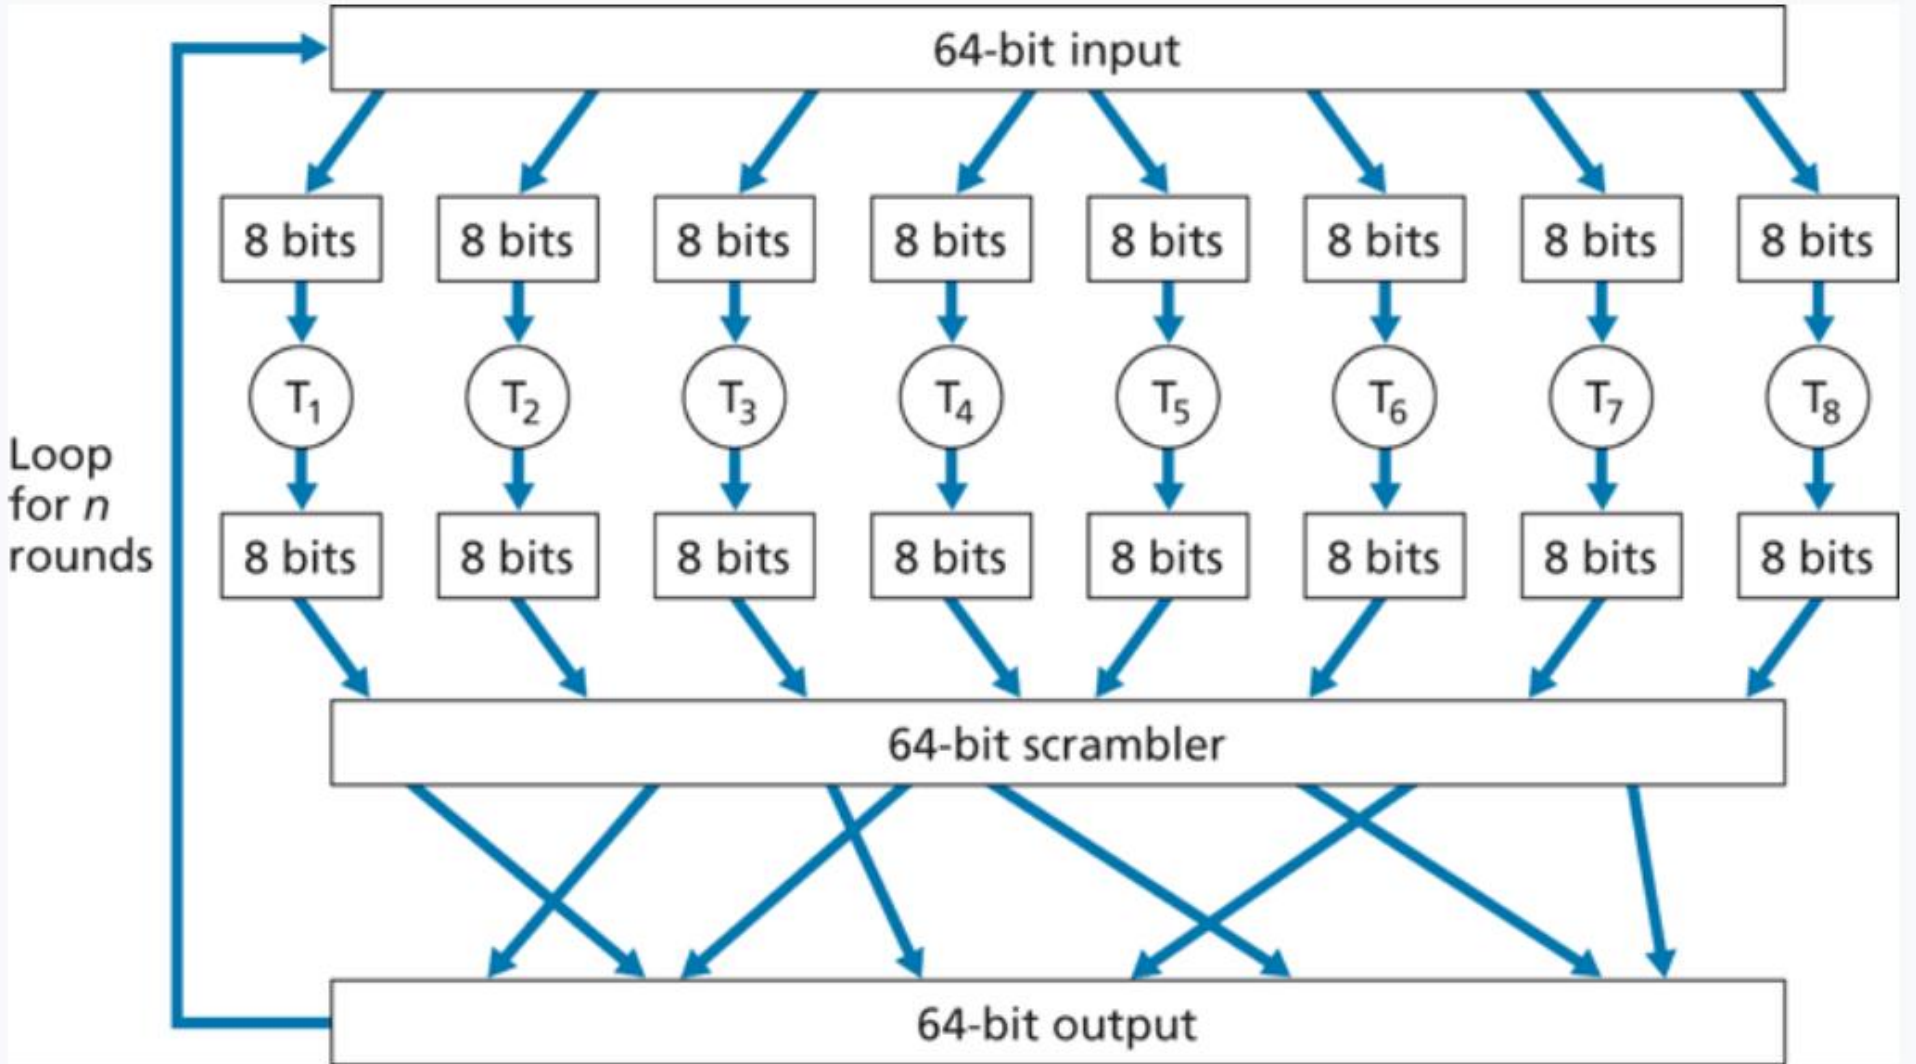

If identical keys are used:

Think about storing table information for 64 block size ☹️

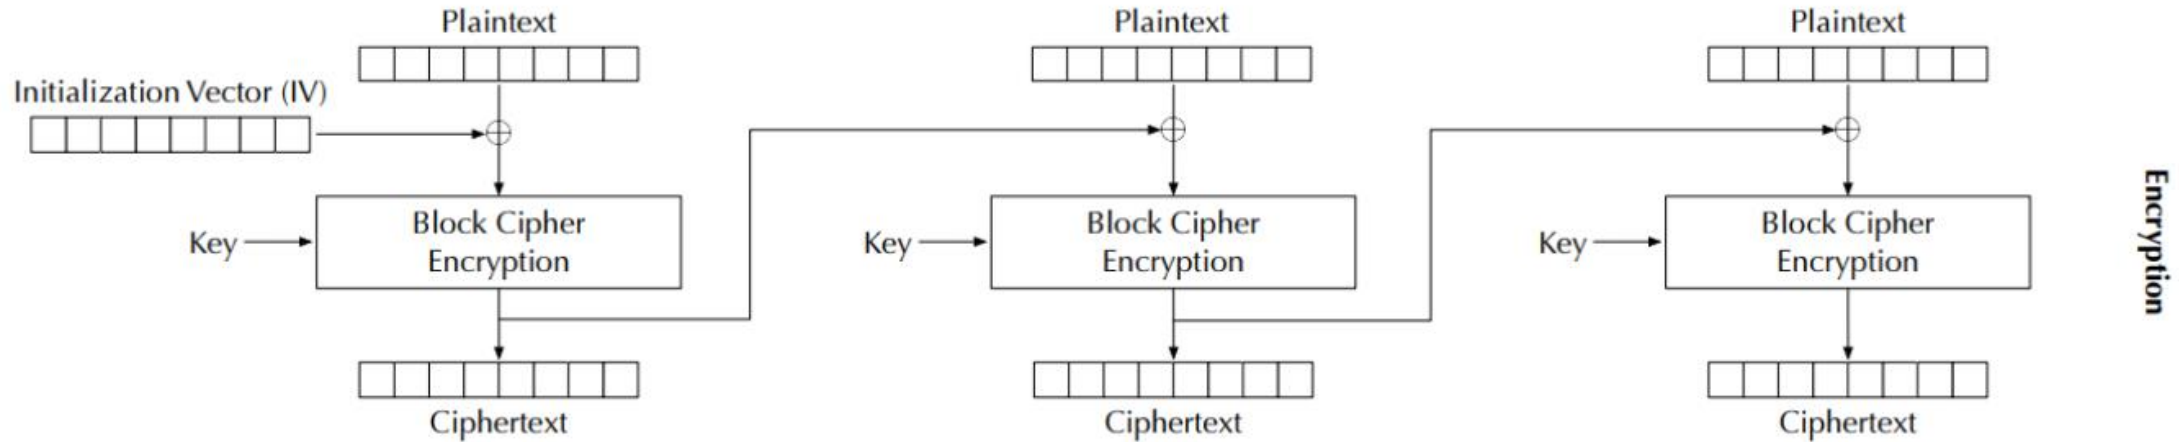

# Block Cipher

# Block Cipher

## Cipher Block Chaining (CBC) Mode

Introduces **block dependency**

$$C_i = E_K(P_i \oplus C_{i-1})$$

Rather than using predetermined tables, block ciphers usually use some type of **function** that simulate randomly permuted tables

Introduces an **initialization vector (IV)** to ensure that even if two plaintexts are identical, their ciphertexts are still different because different IVs will be used

# Block Cipher

The two most common block ciphers are Advanced Encryption Standard (**AES**) and Data Encryption Standard (**DES**)

| <b>AES (2001)</b>                       | <b>DES (1977)</b>                |
|-----------------------------------------|----------------------------------|
| Keys can be of length 128, 192, and 256 | Key length can only be 56        |
| Number of rounds: 10, 12, or 14         | Number of rounds: 16             |
| Very secure (no known attacks)          | Broken (can be cracked easily)   |
| Can encrypt 128 bits of plaintext       | Can encrypt 64 bits of plaintext |
| Faster than DES                         | Slower than AES                  |

(AES is the most widely used symmetric block cipher algorithm nowadays, DES should never be used)

# AES

AES is a rather complicated algorithm (for good reason), you can read more about it on your own

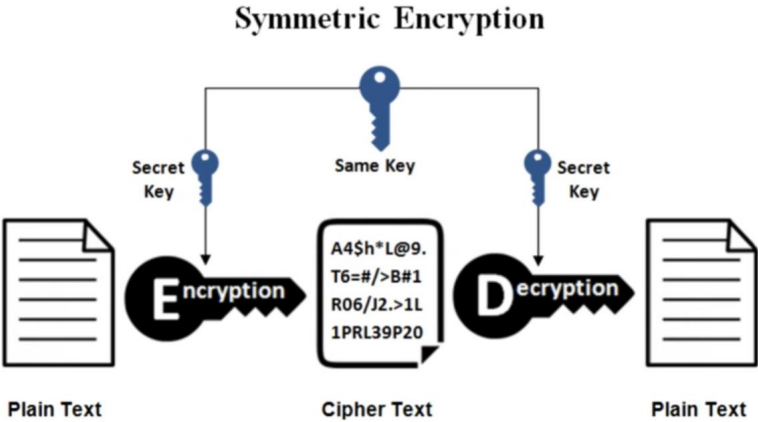

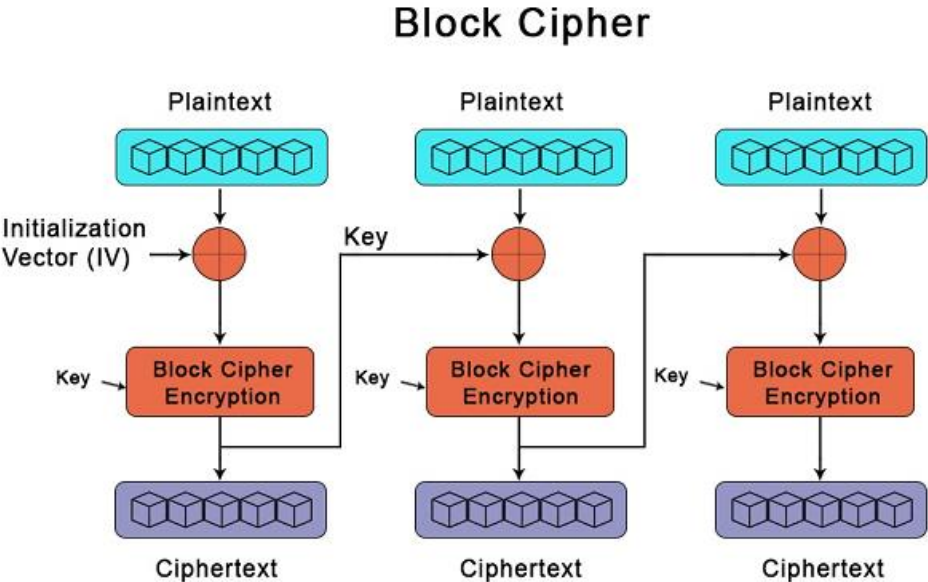

Several rounds of encrypting (“shifting”), using something like CBC

# Symmetric key encryption uses the same, **shared**, key for encrypting and decrypting

What is the one major hurdle we have not discussed yet?

How do the keys get sent without being intercepted? Do the keys get encrypted?

# Asymmetric Cryptography

## AKA Public key Cryptography

The keys used for encrypting and decrypting data are *different*

Additionally, each user now gets two-keys. A **public key**, and a **private key**

This involves some complicated math, and I won't go super deep into it. YouTube videos can explain it much better than I can

**RSA (Rivest–Shamir–Adleman)** is the most popular public key cryptosystem. We rely on it whenever we do communicate securely on the internet

# Asymmetric Cryptography (RSA)

Alice

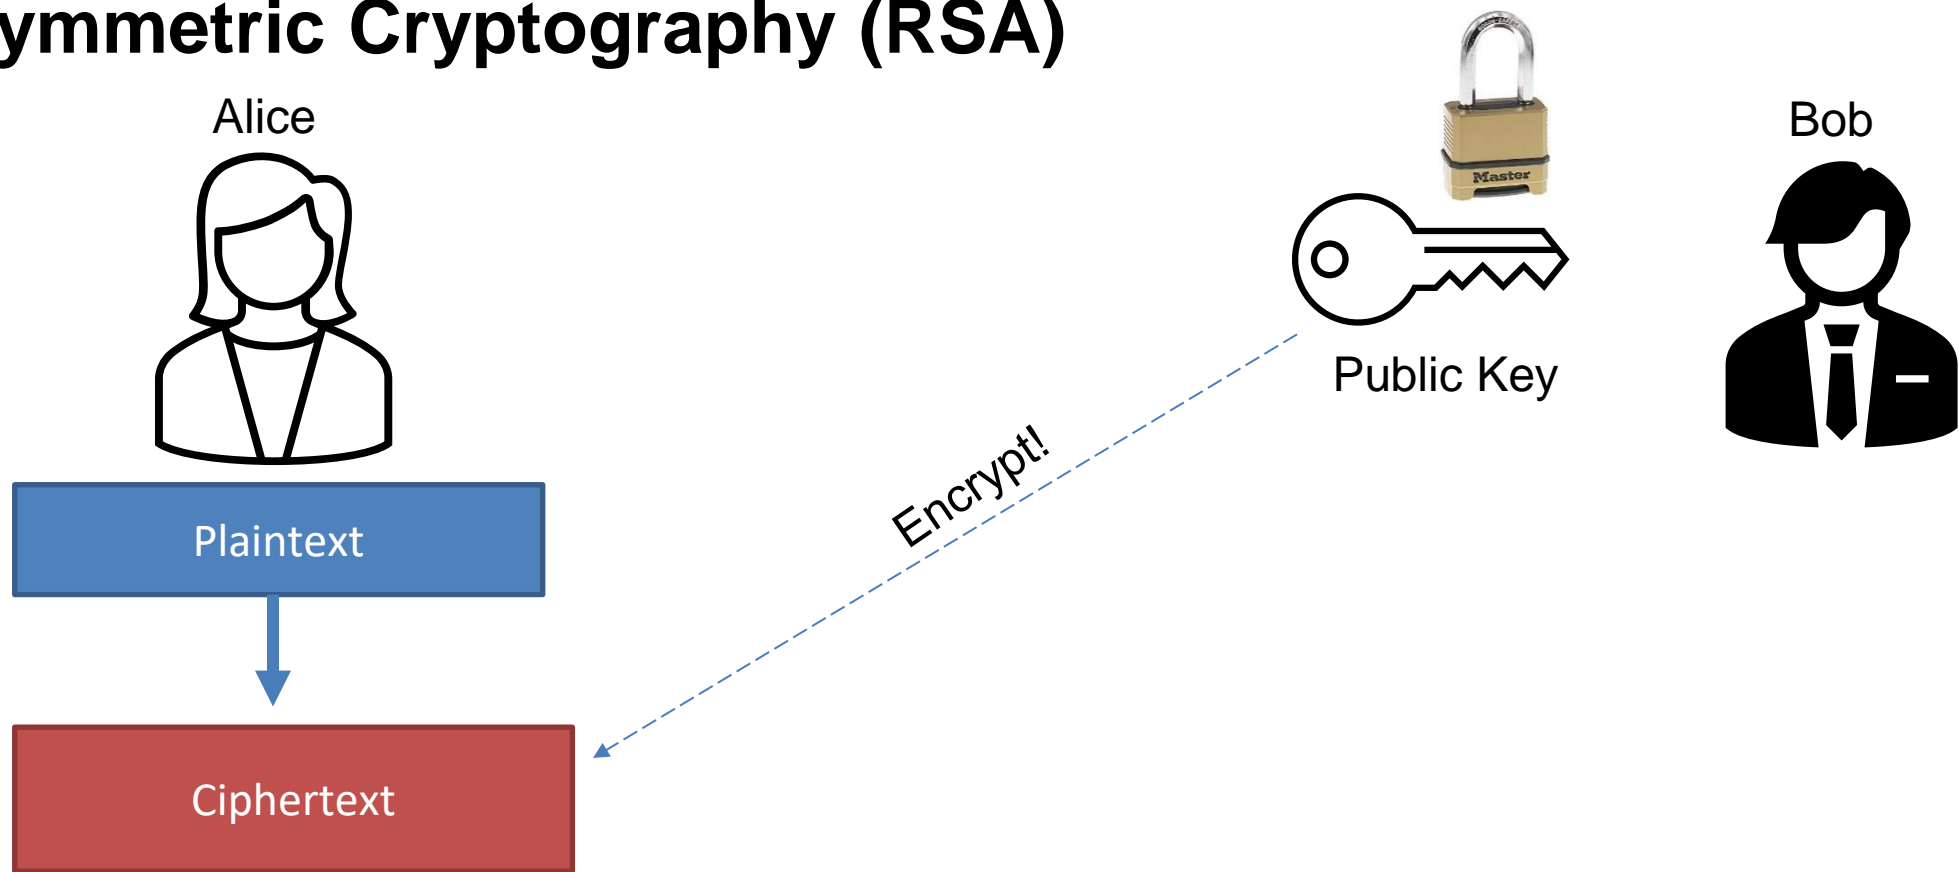

Plaintext

Bob

Alice has a plaintext that she wants to send to bob

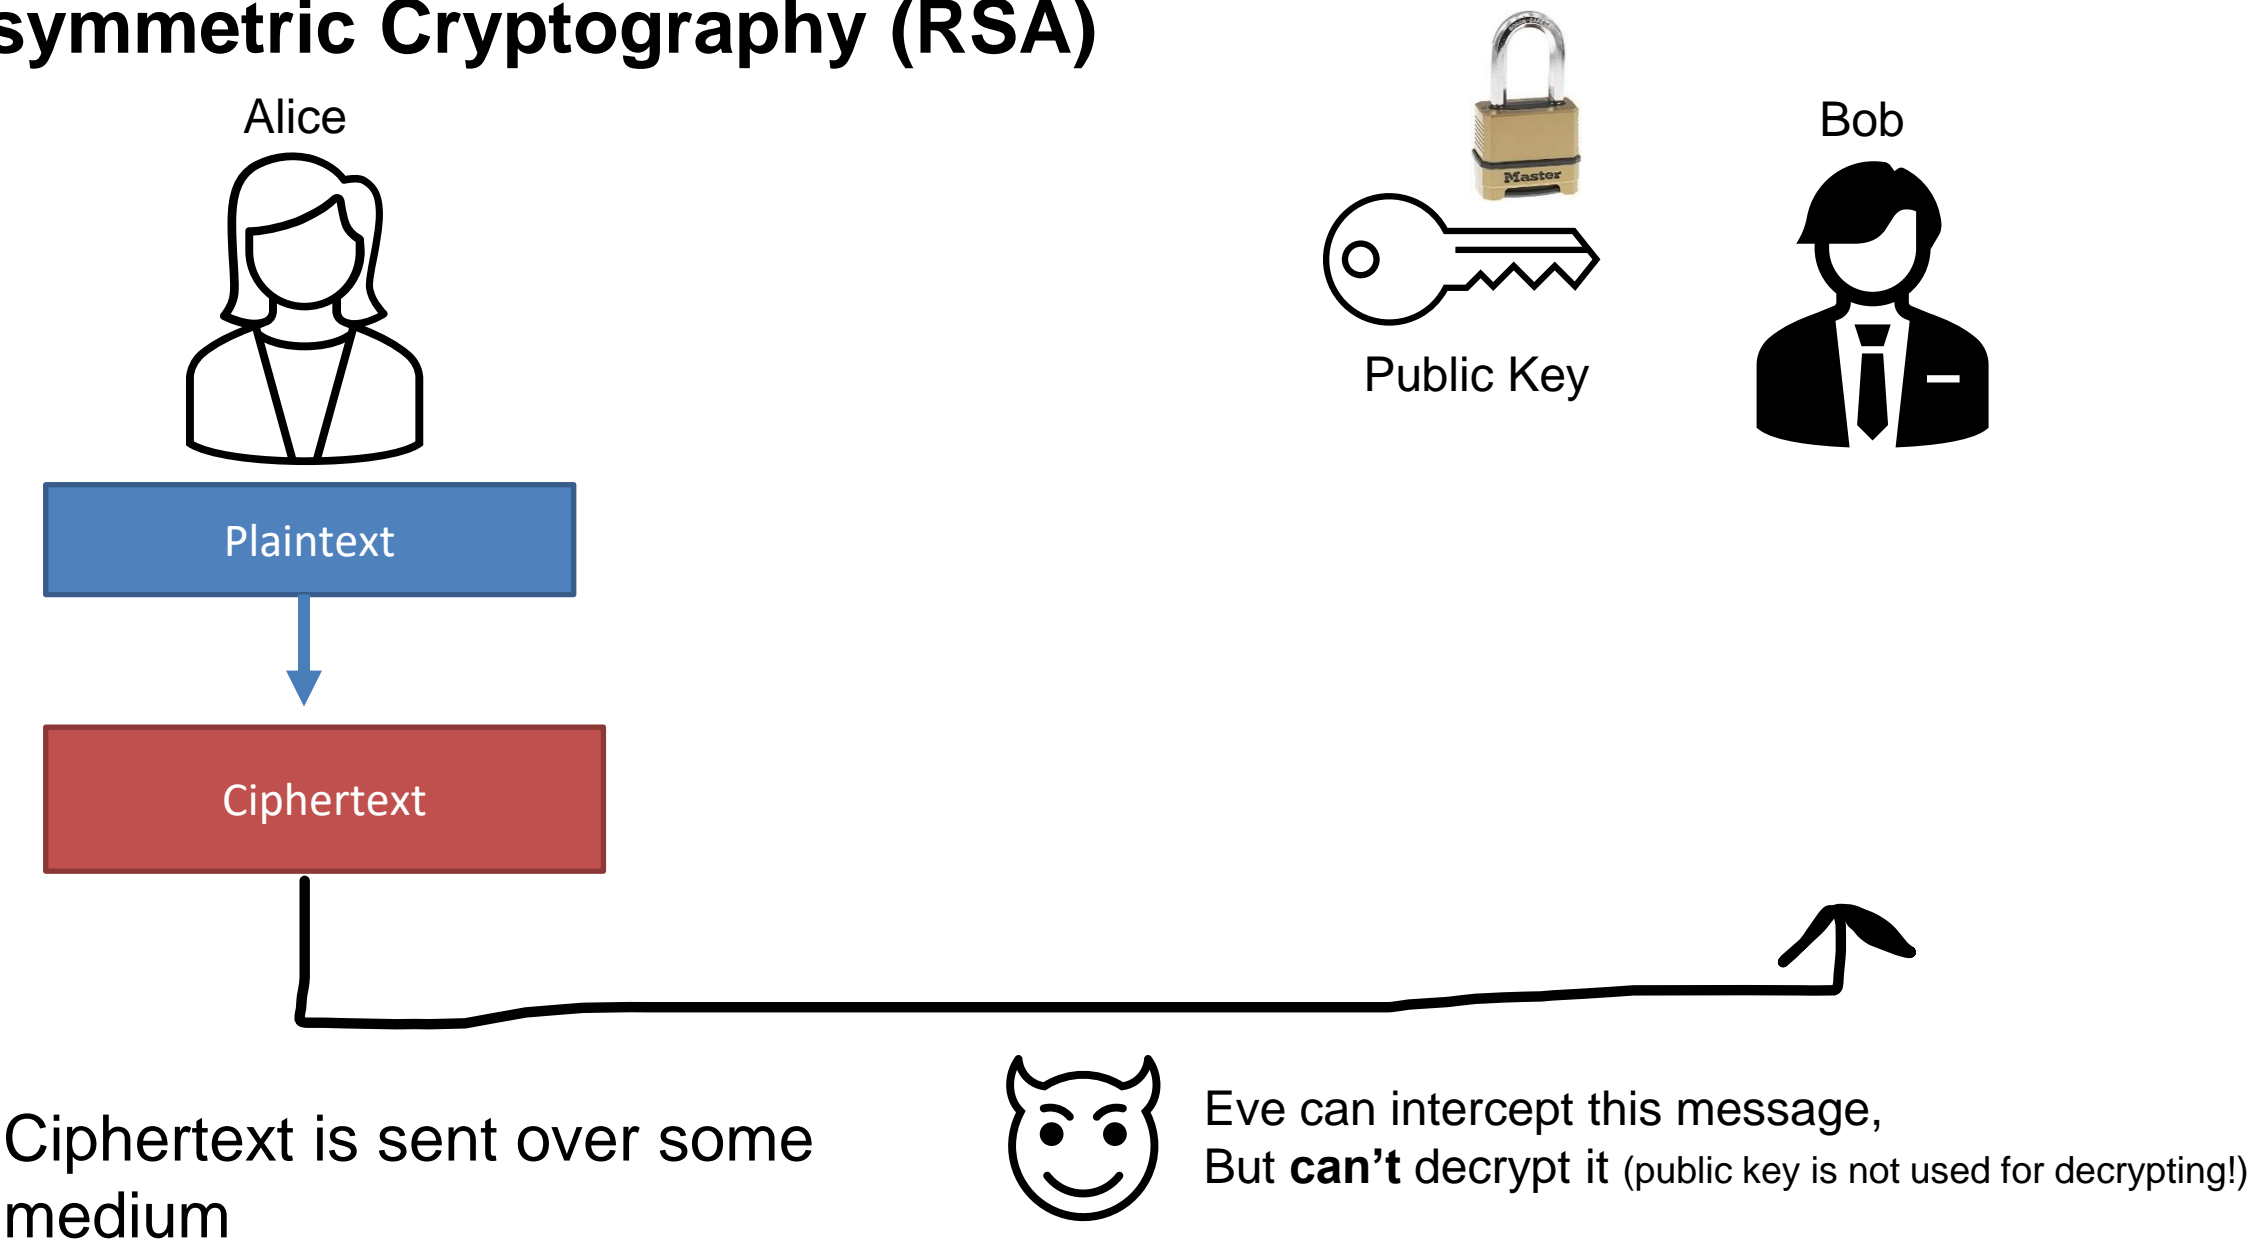

# Asymmetric Cryptography (RSA)

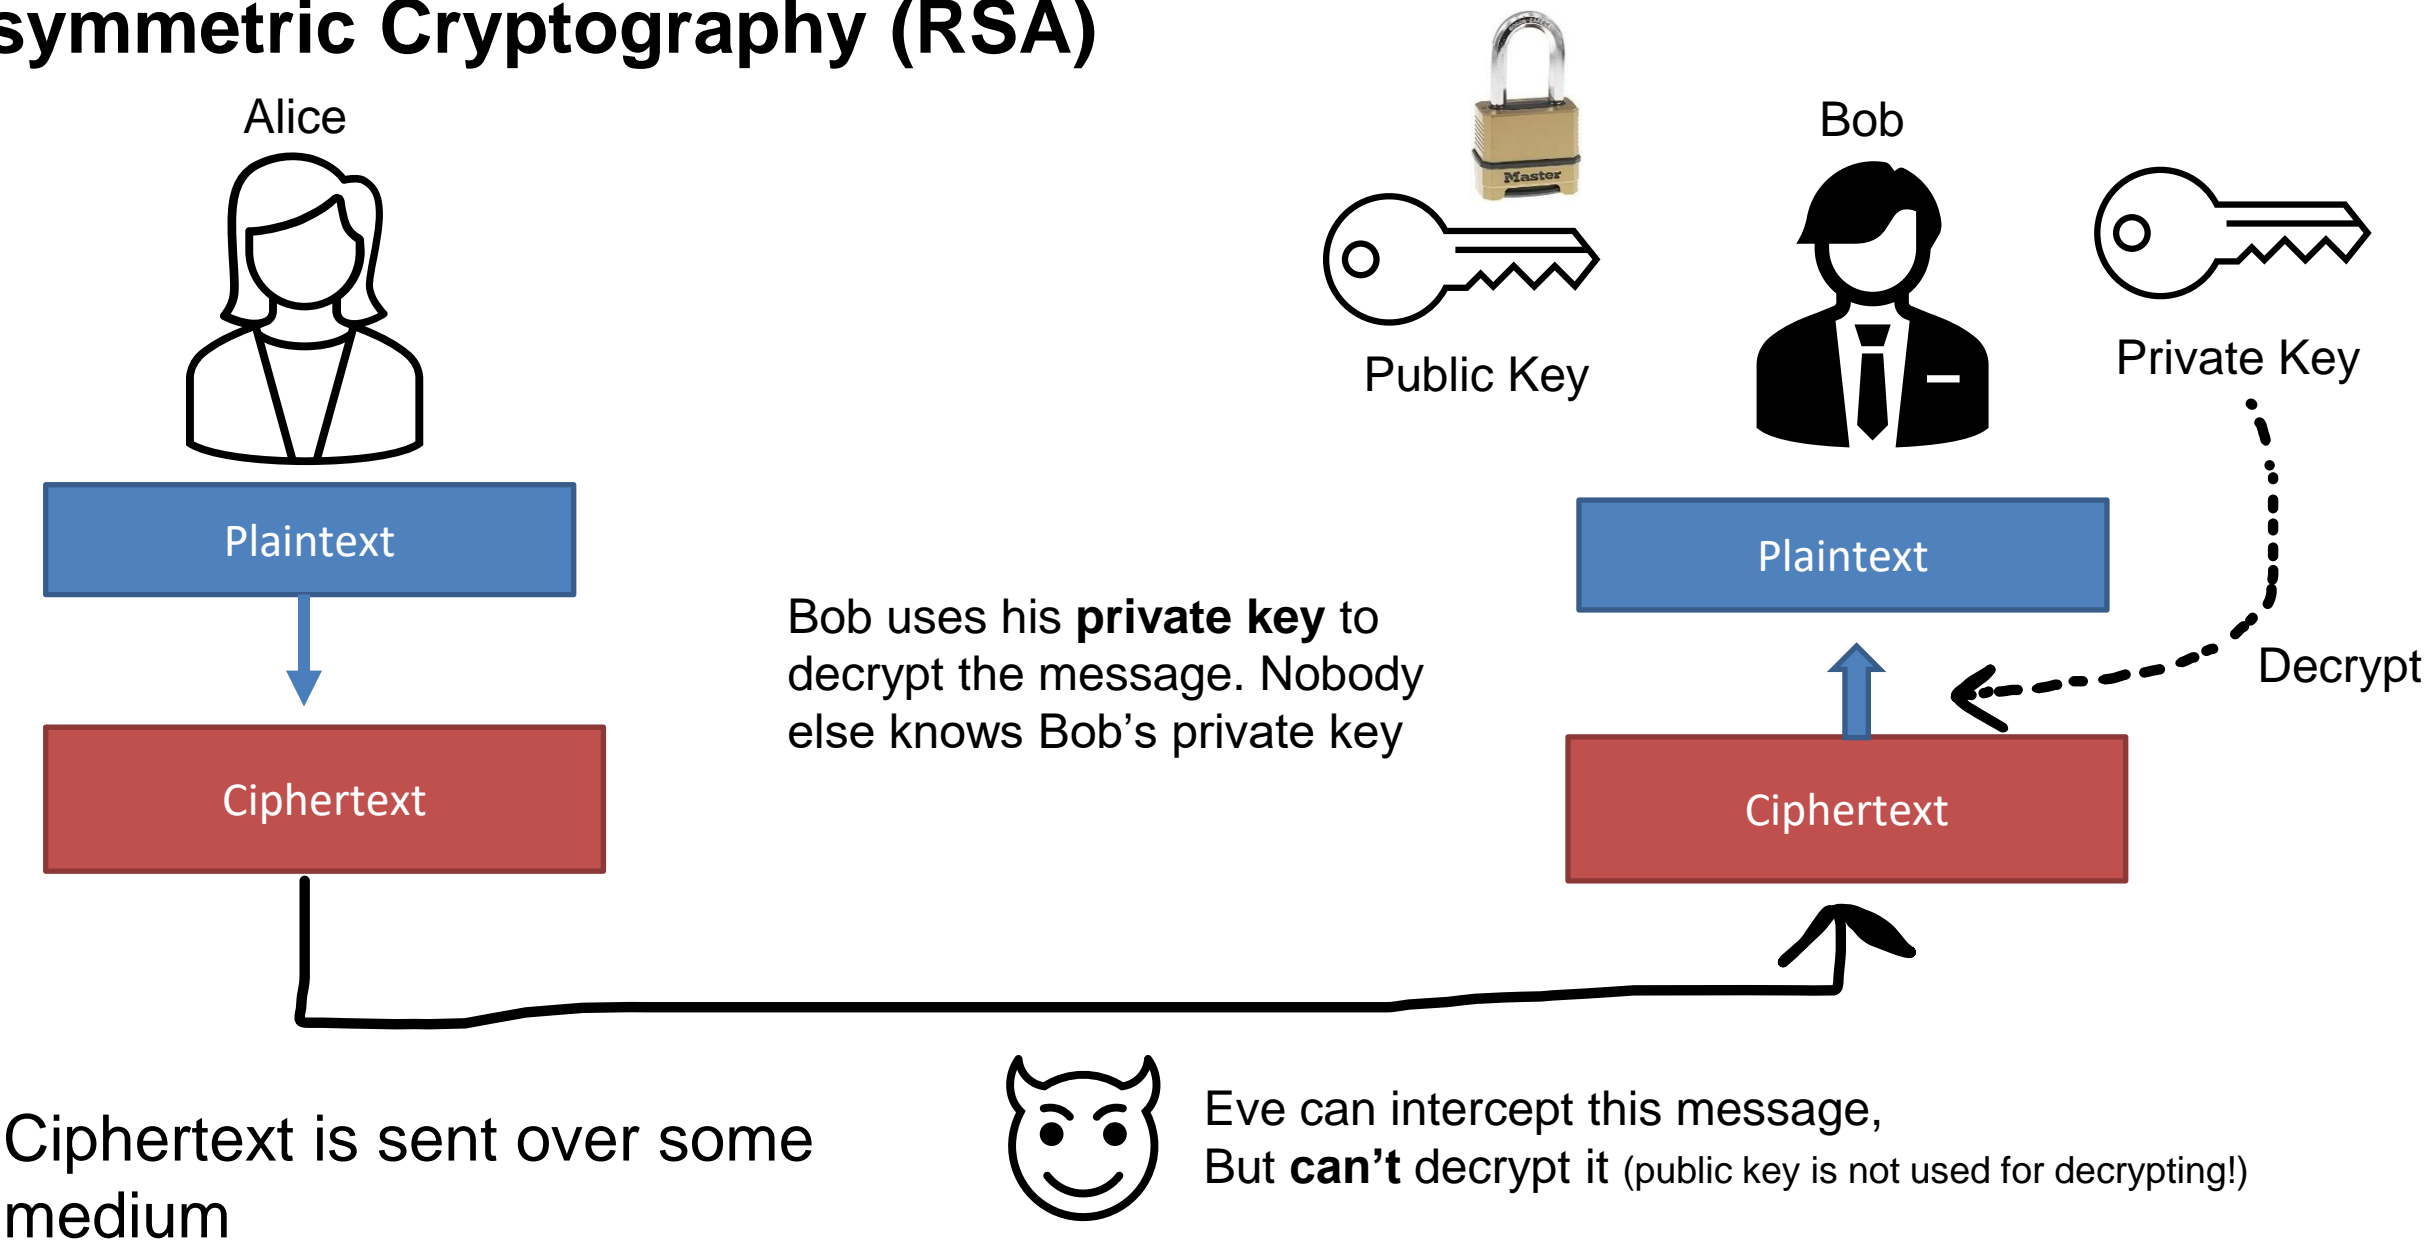

She uses Bob's **public key** to encrypt her message

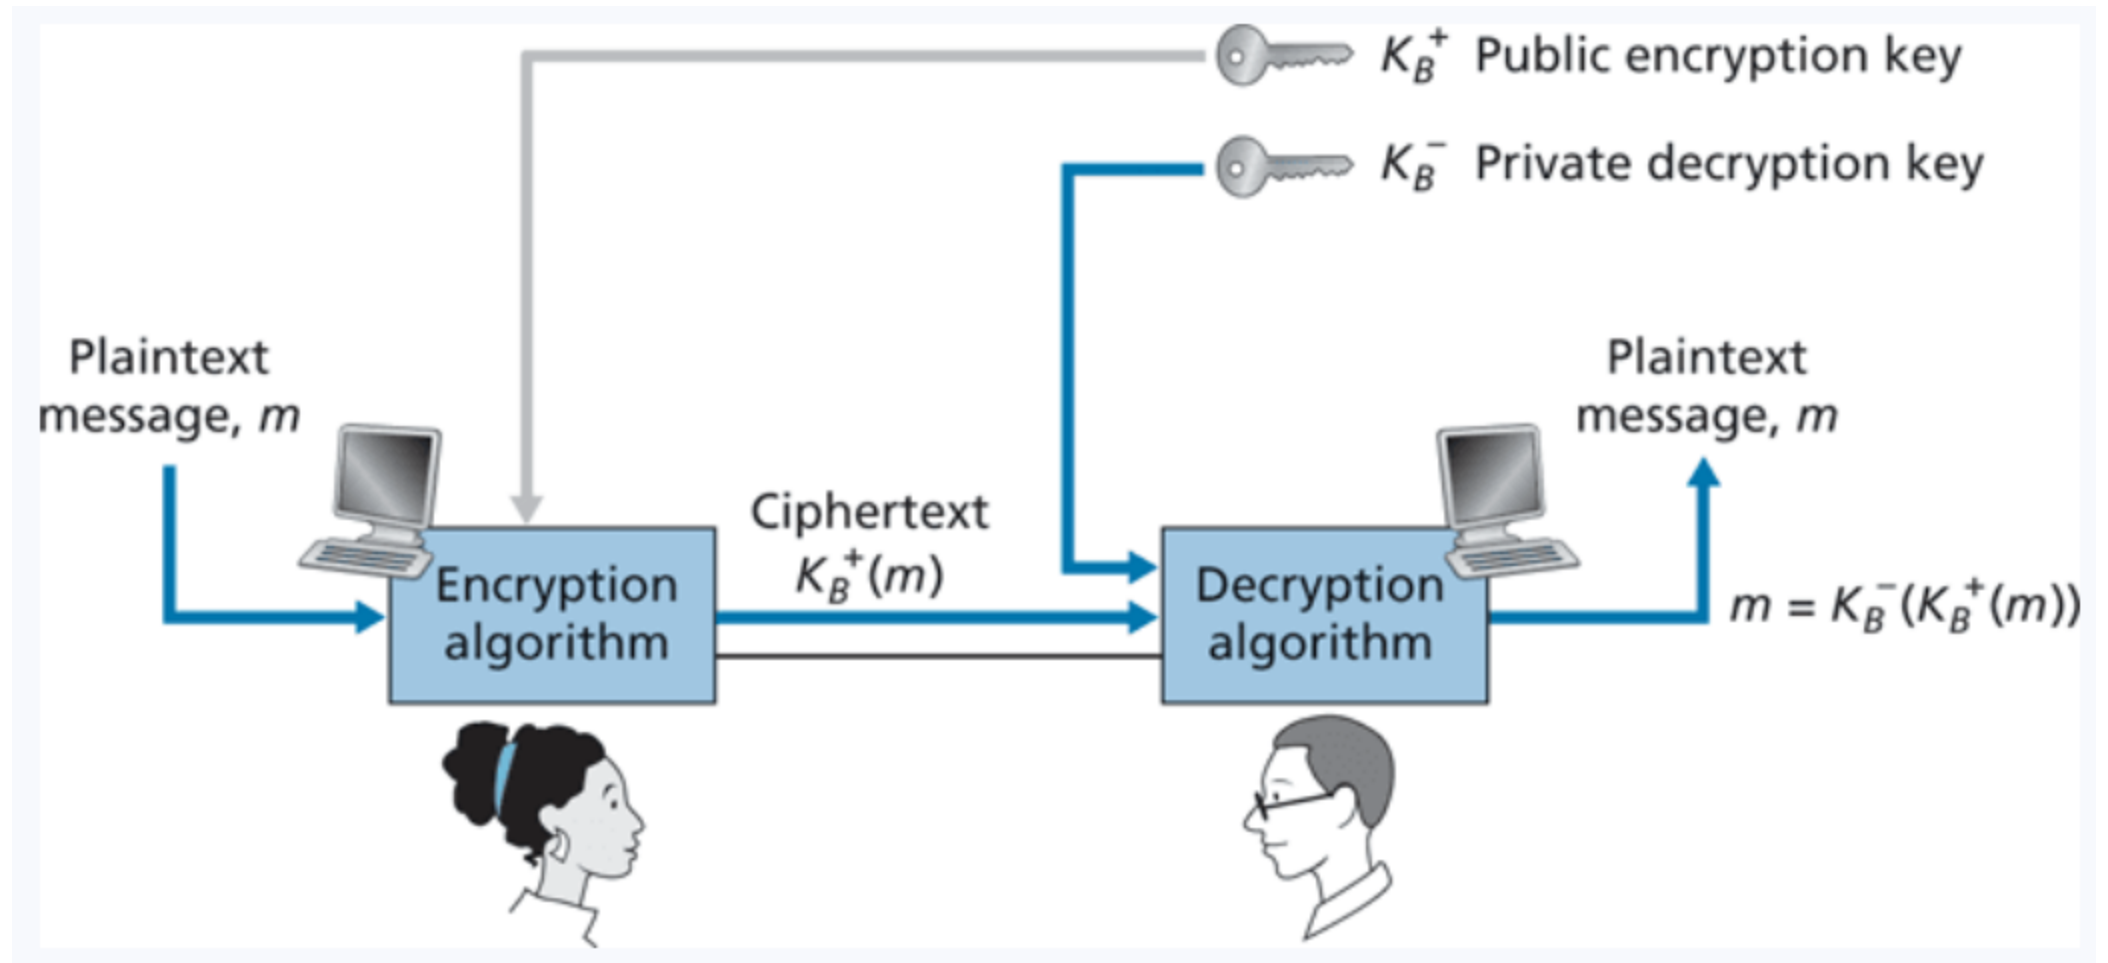

# Asymmetric Cryptography (RSA)

# Asymmetric Cryptography (RSA)

# Asymmetric Cryptography (RSA)

If you multiply two prime numbers (**p** and **q**) together, the product can only be divisible by those two number

5183

$$??? * ??? = 5183$$

This is very difficult to figure out for the people that don't know p or q

In fact, there is not an *efficient* program that can calculate the factors of integers

Remember what these are called?

# Asymmetric Cryptography (RSA)

If you multiply two prime numbers (**p** and **q**) together, the product can only be divisible by those two number

5183

$$??? * ??? = 5183$$

This is very difficult to figure out for the people that don't know p or q

In fact, there is not an *efficient* program that can calculate the factors of integers

This problem is in NP

# Asymmetric Cryptography (RSA)

If you multiply two prime numbers (**p** and **q**) together, the product can only be divisible by those two number

RSA is based on large numbers that are difficult to factorize  
The public and private keys are derived from these prime numbers

How long should RSA keys be? 1024 or 2048 bits long!

The longer the key = the more difficult to crack (exponentially)

# Asymmetric Cryptography (RSA)

$p = 53$   
 $q = 59$

Step 1: Choose two large primer numbers,  $p$  and  $q$

# Asymmetric Cryptography (RSA)

$p = 53$   
 $q = 59$   
 $n = 3127$

Step 1: Choose two large primer numbers,  $p$  and  $q$   
Step 2: Calculate the product  $n$

# Asymmetric Cryptography (RSA)

$p = 53$   
 $q = 59$   
 $n = 3127$

- Step 1: Choose two large
- Step 2: Calculate the product
- Step 3: Calculate  $\Phi(n)$

Relatively prime

The only factor that is common to both 7 and 9 is {1}

7 and 9 are relatively Prime

Factors common to both 8 and 10 are {1, 2}

8 and 10 are NOT relatively prime numbers

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

- 1
- 2
- 3
- ...
- 3125
- 3126

How many of these numbers are relatively prime w/ 3127?

# Asymmetric Cryptography (RSA)

Eve's stolen goods

$p = 53$   
 $q = 59$   
 $n = 3127$

Step 1: Choose two large  
Step 2: Calculate the product  
Step 3: Calculate  $\Phi(n)$

## Relatively prime

The only factor that is common to both 7 and 9 is {1}

7 and 9 are relatively Prime

Factors common to both 8 and 10 are {1, 2}

8 and 10 are NOT relatively prime numbers

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

1  
2  
3  
...  
3125  
3126

How many of these numbers are relatively prime w/ 3127?

Difficult.. But very easy for the product of two prime #s!

# Asymmetric Cryptography (RSA)

Eve's stolen goods

$p = 53$   
 $q = 59$   
 $n = 3127$

$\Phi(n)$  = number of values less than  $n$   
which are *relatively prime* to  $n$

- Step 1: Choose two large primer numbers,  $p$  and  $q$
- Step 2: Calculate the product  $n$
- Step 3: Calculate  $\Phi(n)$

The  $\Phi(n)$  of a product of two prime numbers will always be  $(p-1)(q-1)$

# Asymmetric Cryptography (RSA)

$$p = 53$$

$$q = 59$$

$$n = 3127$$

$$\Phi(n) = 52 \cdot 28 = 3016$$

$\Phi(n)$  = number of values less than  $n$   
which are *relatively prime* to  $n$

The  $\Phi(n)$  of a product of two prime  
numbers will always be  $(p-1)(q-1)$

Step 1: Choose two large primer numbers,  $p$  and  $q$

Step 2: Calculate the product  $n$

Step 3: Calculate  $\Phi(n)$

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

Eve's stolen goods

$p = 53$   
 $q = 59$   
 $n = 3127$   
 $\Phi(n) = 3016$

$e = 1 < e < \Phi(n)$   
Not be a factor of  $n$ , but an integer

- Step 1: Choose two large primer numbers,  $p$  and  $q$
- Step 2: Calculate the product  $n$
- Step 3: Calculate  $\Phi(n)$
- Step 4: Choose public exponent  $e$

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

Eve's stolen goods

$p = 53$   
 $q = 59$   
 $n = 3127$   
 $\Phi(n) = 3016$   
 $e = 3$

$e = 1 < e < \Phi(n)$   
Not be a factor of  $n$ , but an integer

- Step 1: Choose two large primer numbers,  $p$  and  $q$
- Step 2: Calculate the product  $n$
- Step 3: Calculate  $\Phi(n)$
- Step 4: Choose public exponent  $e$

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

Eve's stolen goods

$p = 53$   
 $q = 59$   
 $n = 3127$   
 $\Phi(n) = 3016$   
 $e = 3$

$$d = \frac{K * \Phi(n) + 1}{e}$$

- Step 1: Choose two large primer numbers,  $p$  and  $q$
- Step 2: Calculate the product  $n$
- Step 3: Calculate  $\Phi(n)$
- Step 4: Choose public exponent  $e$
- Step 5: Select private exponent  $d$

$K$  = some integer that will make the quotient an integer

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

Eve's stolen goods

$p = 53$   
 $q = 59$   
 $n = 3127$   
 $\Phi(n) = 3016$   
 $e = 3$

$$d = \frac{2 * 3016 + 1}{3}$$

- Step 1: Choose two large primer numbers,  $p$  and  $q$
- Step 2: Calculate the product  $n$
- Step 3: Calculate  $\Phi(n)$
- Step 4: Choose public exponent  $e$
- Step 5: Select private exponent  $d$

$K$  = some integer that will make the quotient an integer

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

$p = 53$   
 $q = 59$   
 $n = 3127$   
 $\Phi(n) = 3016$   
 $e = 3$   
 $d = 2011$

$$d = \frac{2 * 3016 + 1}{3}$$

- Step 1: Choose two large primer numbers,  $p$  and  $q$
- Step 2: Calculate the product  $n$
- Step 3: Calculate  $\Phi(n)$
- Step 4: Choose public exponent  $e$
- Step 5: Select private exponent  $d$

$K$  = some integer that will make the quotient an integer

# Asymmetric Cryptography (RSA)

Eve's stolen goods

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

Alice's Public Key

$n = 3127$   
 $e = 3$

Secret Information

$p = 53$   
 $q = 59$   
 $\Phi(n) = 3016$   
 $d = 2011$

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

Eve's stolen goods

Alice's Public Key

$n = 3127$   
 $e = 3$

Bob has a message to send to Alice

HI  $\rightarrow$  89

Message must be converted into a number

Secret Information

$p = 53$   
 $q = 59$   
 $\Phi(n) = 3016$   
 $d = 2011$

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

$n = 3127$   
 $e = 3$

Eve's stolen goods

Alice's Public Key

$n = 3127$   
 $e = 3$

Bob has a message to send to Alice

89

Use Alice's Public Key to encrypt

$$m^e \bmod 3127$$

Secret Information

$p = 53$   
 $q = 59$   
 $\Phi(n) = 3016$   
 $d = 2011$

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

$n = 3127$   
 $e = 3$

Eve's stolen goods

Alice's Public Key

$n = 3127$   
 $e = 3$

Bob has a message to send to Alice

89

Use Alice's Public Key to encrypt

$$89^3 \bmod 3127$$
$$C = 1394$$

Secret Information

$p = 53$   
 $q = 59$   
 $\Phi(n) = 3016$   
 $d = 2011$

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

Alice

$p = 53$   
 $q = 59$   
 $\Phi(n) = 3016$   
 $d = 2011$

Eve's stolen goods

$n = 3127$   
 $e = 3$   
 $c = 1394$

Bob

Alice's Public Key

$n = 3127$   
 $e = 3$

Bob has a message to send to Alice

89

Use Alice's Public Key to encrypt

$$89^3 \bmod 3127$$

$C = 1394$

2011

$$1394^{2011} \bmod 3127$$

Alice decrypts message using her private key

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

Alice

$p = 53$   
 $q = 59$   
 $\Phi(n) = 3016$   
 $d = 2011$

Eve's stolen goods

$n = 3127$   
 $e = 3$   
 $c = 1394$

Bob

Alice's Public Key

$n = 3127$   
 $e = 3$

Bob has a message to send to Alice

89

Use Alice's Public Key to encrypt

$1394^{2011} \bmod 3127 = 89$  ✓

Alice decrypts message using her private key

$89^3 \bmod 3127$   
 $C = 1394$

# Asymmetric Cryptography (RSA)

$\Phi(n)$  = number of values less than  $n$  which are *relatively prime* to  $n$

Alice

$p = 53$   
 $q = 59$   
 $\Phi(n) = 3016$   
 $d = 2011$

Eve's stolen goods

$n = 3127$   
 $e = 3$   
 $c = 1394$

Bob

Alice's Public Key

$n = 3127$   
 $e = 3$

Bob has a message to send to Alice

89

Alice's Private Key

$n = 3127$   
 $d = 2011$

What does eve know??

$???^3 \bmod 3127 = 1394$

These is very difficult to figure out, since she does not know the factorization of  $n$

Use Alice's Public Key to encrypt

$89^3 \bmod 3127$   
 $C = 1394$

# Asymmetric Cryptography (RSA)

We now have a method for sending secure messages over a possibly unsecure channel!

Limitation of RSA: Can only encrypted data that is smaller or equal to key length ( < 2048 bits )

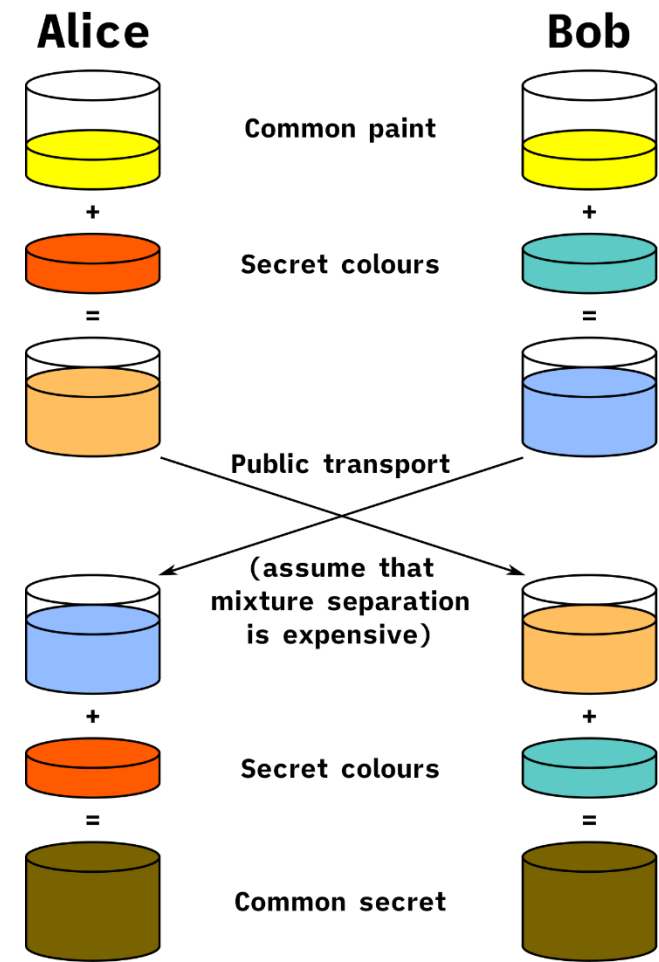

# Asymmetric Cryptography (RSA)

We now have a method for sending secure messages over a possibly unsecure channel!

Limitation of RSA: Can only encrypted data that is smaller or equal to key length ( < 2048 bits )

What could we encrypt instead??

# Asymmetric Cryptography (RSA)

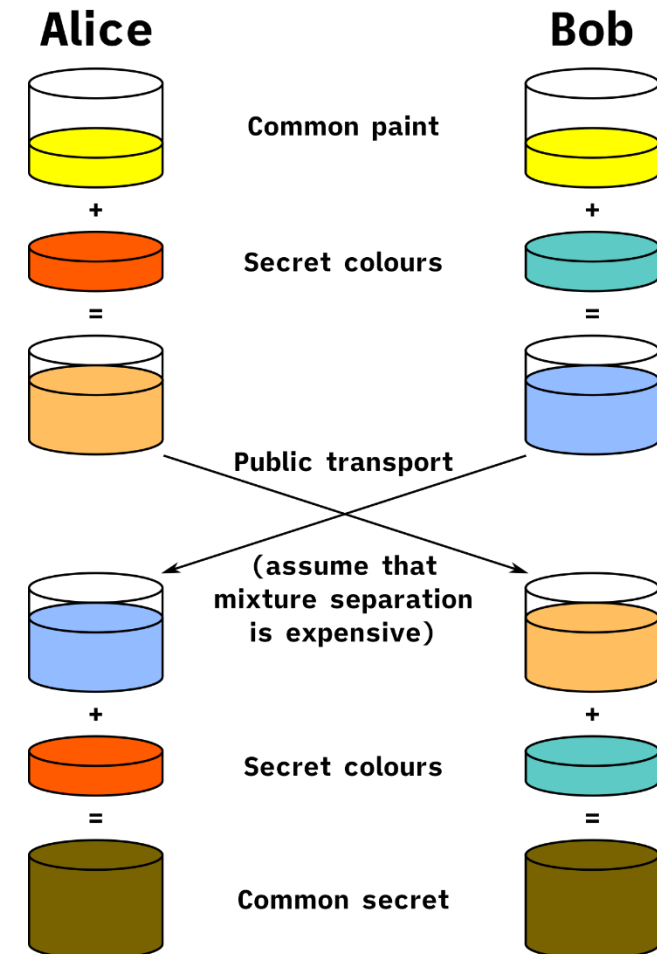

We now have a method for sending secure messages over a possibly unsecure channel!

Limitation of RSA: Can only encrypted data that is smaller or equal to key length ( < 2048 bits )

What could we encrypt instead??

The key for a symmetric cryptography algorithm! ( < 2048 bits)

RSA can be used to generate **session key**, which can then be used to encrypt many chunks of data (also much faster than asymmetric crypto)

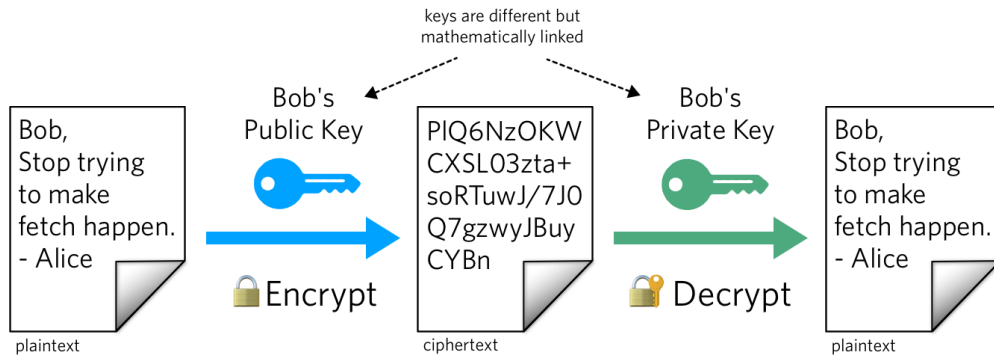

# Review

## Symmetric Encryption

- Same key used for encrypting and decrypting
- Using block ciphers (AES), we can encrypt an arbitrary size of data
- Issue: How to securely share secret keys with each other?

## Public Key Cryptography

- Two keys: Public Key (a lock), and a private key (the key)
- Public key is used to encrypt. Private key used to decrypt message
- Using math, we can securely send messages over an unsecure channel without sharing any sensitive information
- Issue: We can not encrypt stuff bigger than our key (2048 bits)

- symmetric and asymmetric cryptography are used **together**

(use RSA to send the key for symmetric crypto!)
