Shortest Path

Shortest Path

What is the shortest path between **vertex 0** and **vertex 6**?

Path with the smallest sum of edge weights.

Shortest Path

Assumptions:

- Graph is directed.
- Graph is edge-weighted.
- Edge weights are non-negative.
- Graph need not be simple (though our example will be).

What is the shortest path between **vertex 0** and **vertex 6**?

Path with the smallest sum of edge weights.

Shortest Path

Assumptions:

- Graph is directed.
- Graph is edge-weighted.
- Edge weights are non-negative.
- Graph need not be simple (though our example will be).

Ideas?

What is the shortest path between **vertex 0** and **vertex 6**?

Path with the smallest sum of edge weights.

Shortest Path

We are going to find the shortest path between vertex 0 and every other vertex, flooding out from 0.

Shortest Path

Assumptions:

- Graph is directed.
- Graph is edge-weighted.
- Edge weights are non-negative.
- Graph need not be simple (though our example will be).

What happens if there are self-loops?

Shortest Path

Assumptions:

- Graph is directed.
- Graph is edge-weighted.
- Edge weights are non-negative.
- Graph need not be simple (though our example will be).

What happens if there are self-loops?

They are never taken, since they will never lower the cost of a path.

Shortest Path

Assumptions:

- Graph is directed.
- Graph is edge-weighted.
- Edge weights are non-negative.
- Graph need not be simple (though our example will be).

What happens if there are parallel edges?

Shortest Path

Assumptions:

- Graph is directed.
- Graph is edge-weighted.
- Edge weights are non-negative.
- Graph need not be simple (though our example will be).

What happens if there are parallel edges?

The cheapest one is taken and all others are ignored.

Shortest Path

Assumptions:

- Graph is directed.
- Graph is edge-weighted.
- Edge weights are non-negative.
- Graph need not be simple (though our example will be).

What happens if there are negative weights?

Shortest Path

Assumptions:

- Graph is directed.
- Graph is edge-weighted.
- Edge weights are non-negative.
- Graph need not be simple (though our example will be).

What happens if there are negative weights?
