

CSCI 466: Networks

Transport Layer (Multiplexing, Error Checking)

Reese Pearsall
Fall 2024

Announcements

PA1 Due **Sunday** @ 11:59 PM

- Files must be pushed to a PA1 folder on your GitHub Repo
- Video demo is required
- Submit your repo link to D2L when finished
- Adding `time.sleep()` after your `.send` calls can resolve timing issues

Quiz on Friday

Put a README in head of your folders. Provide the video demo link, group members, and instructions for how to run

h-csci466 / PA1 /

Name	Last commit message
..	
README.md	Update README.md
client.py	Edits to client.py and server.py
server.py	Edits to client.py and server.py

README.md

Demo Videos:

Group Members:

-
-

How to run:

1. Run server.py via the command line and give it an extra instruction for the port number (python server.py [PORT NUMBER])
2. Run client.py via the command line and give it an extra instruction for the port number (python client.py [PORT NUMBER])
3. Play Battleship from the terminal running client.py by entering coordinates.

UDP Sockets

OSI Model

Application Layer

Presentation Layer *

Session Layer *

Transport Layer

Network Layer

Data Link Layer

Physical Layer

Application Layer

Messages from Network Applications

Physical Layer

Bits being transmitted over a copper wire

**In the textbook, they condense it to a 5-layer model, but 7 layers is what is most used*

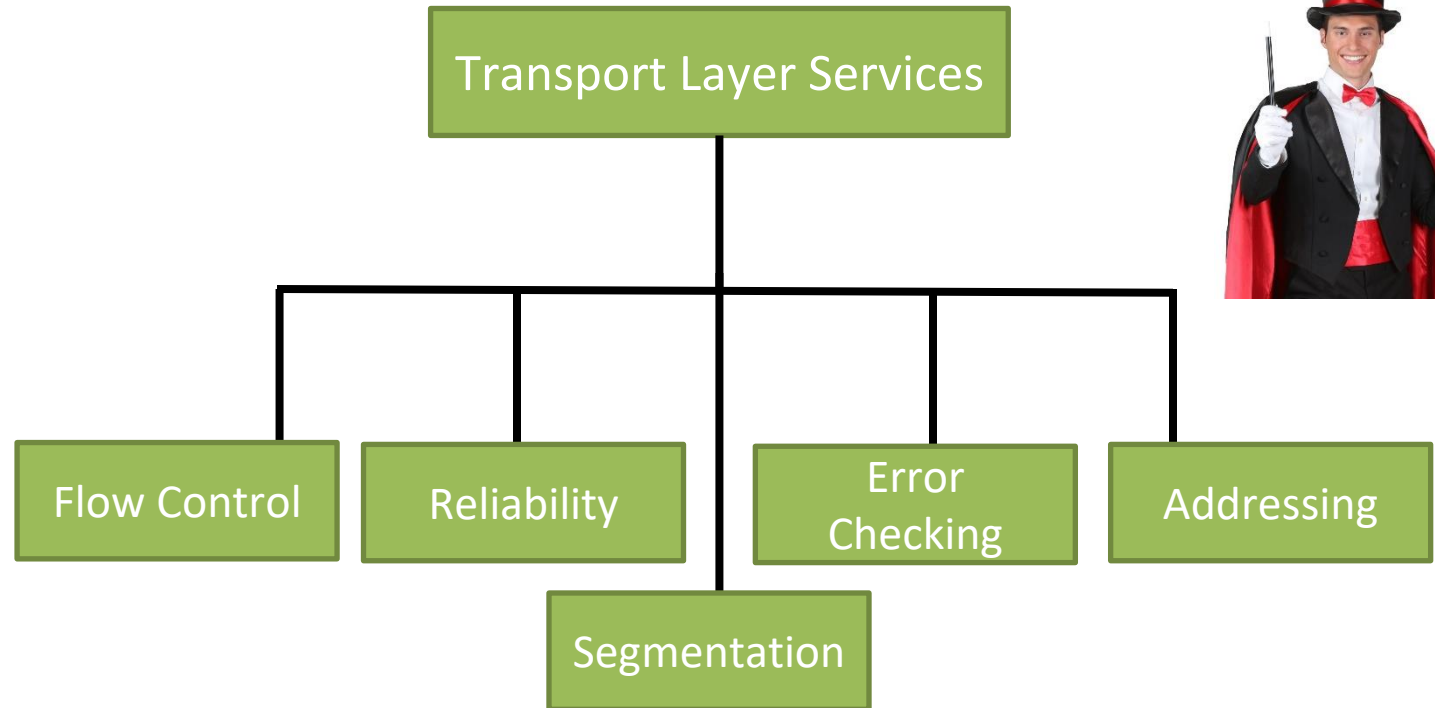

Transport Layer

Provides *logical* end-to-end communication between application **processes**

(Network layer handles delivery between **hosts**)

Important Services

- Flow Control
- Reliability
- Segmentation
- Error Checking
- Addressing

Transport Layer

Transport Layer

Bill

Ann

Transport Layer

Bill and Ann are responsible for collecting their siblings mail...

Transport Layer

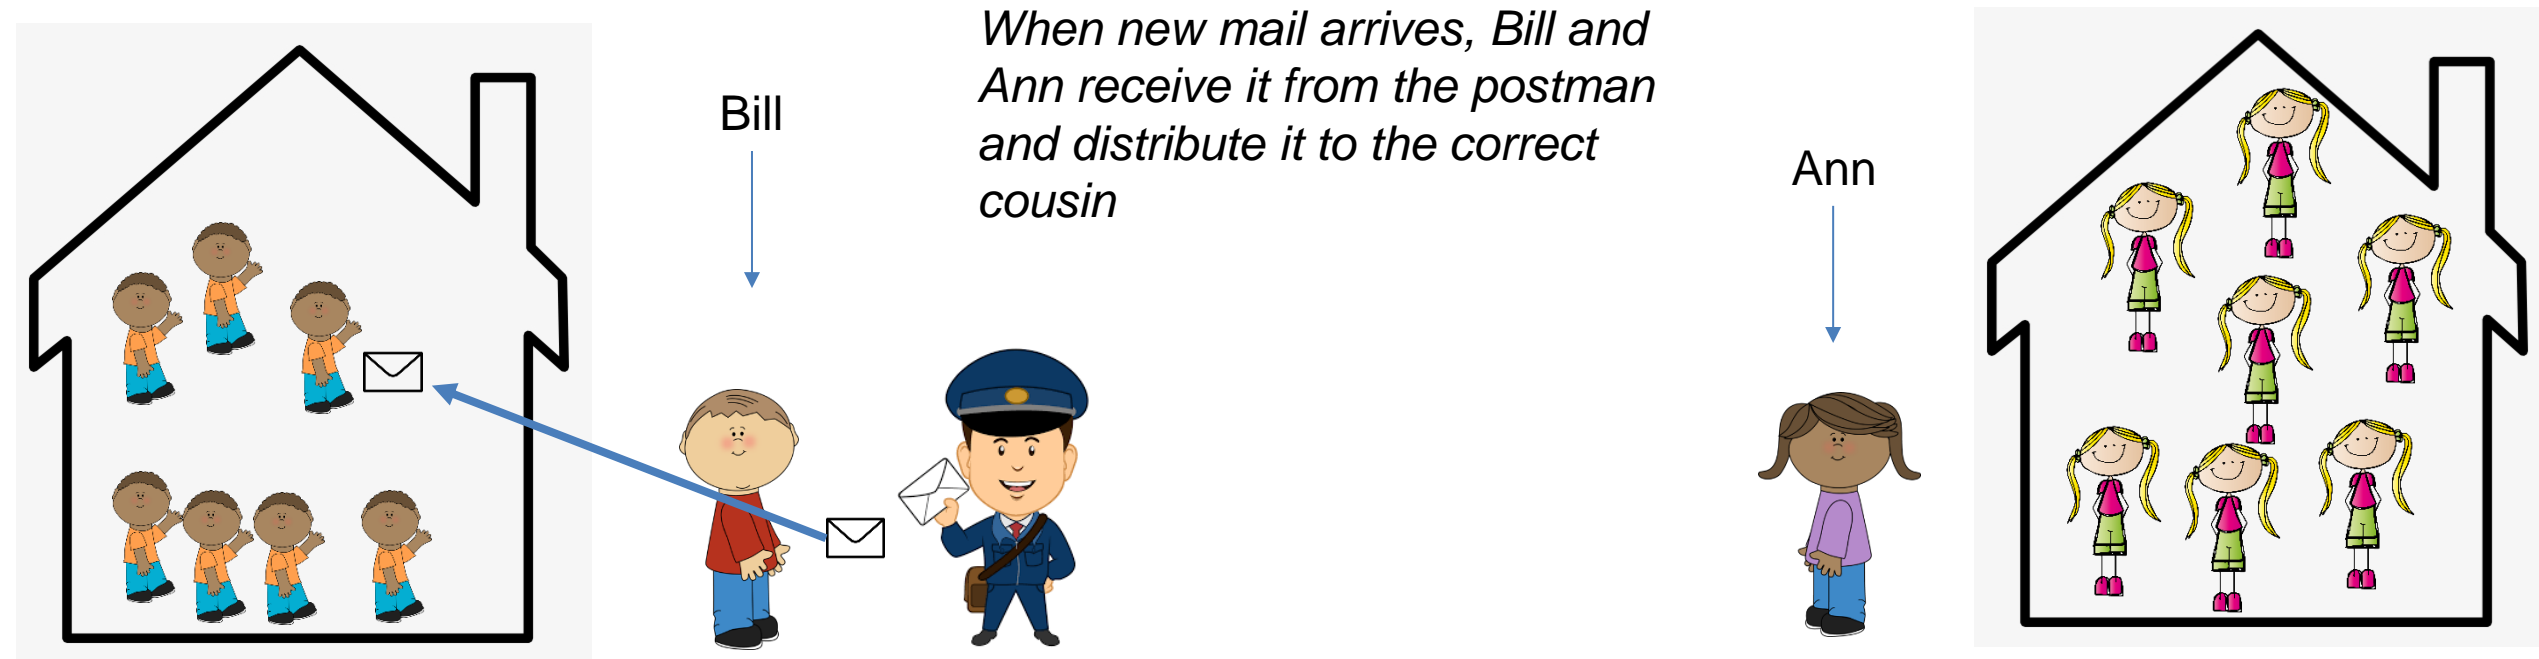

Bill and Ann are responsible for collecting their siblings mail...
And delivering it to the postal service worker

Transport Layer

Bill and Ann are responsible for collecting their siblings mail...
And delivering it to the postal service worker

Transport Layer

Bill and Ann are responsible for collecting their siblings mail...
And delivering it to the postal service worker

Ann and Bill = Transport Layer Protocol
Postal Service = Network Layer/Network core

Bill

Ann

From the perspective of the cousins, Bill and Ann are the postal service

What if Bill and Ann are sick?

Transport Layer

TCP – Reliable, Connection-oriented transport layer protocol

UDP – Unreliable, connectionless transport layer protocol

Application	Application-Layer Protocol	Underlying Transport Protocol
Electronic mail	SMTP	TCP
Remote terminal access	Telnet	TCP
Secure remote terminal access	SSH	TCP
Web	HTTP, HTTP/3	TCP (for HTTP), UDP (for HTTP/3)
File transfer	FTP	TCP
Remote file server	NFS	Typically UDP
Streaming multimedia	DASH	TCP
Internet telephony	typically proprietary	UDP or TCP
Network management	SNMP	Typically UDP
Name translation	DNS	Typically UDP

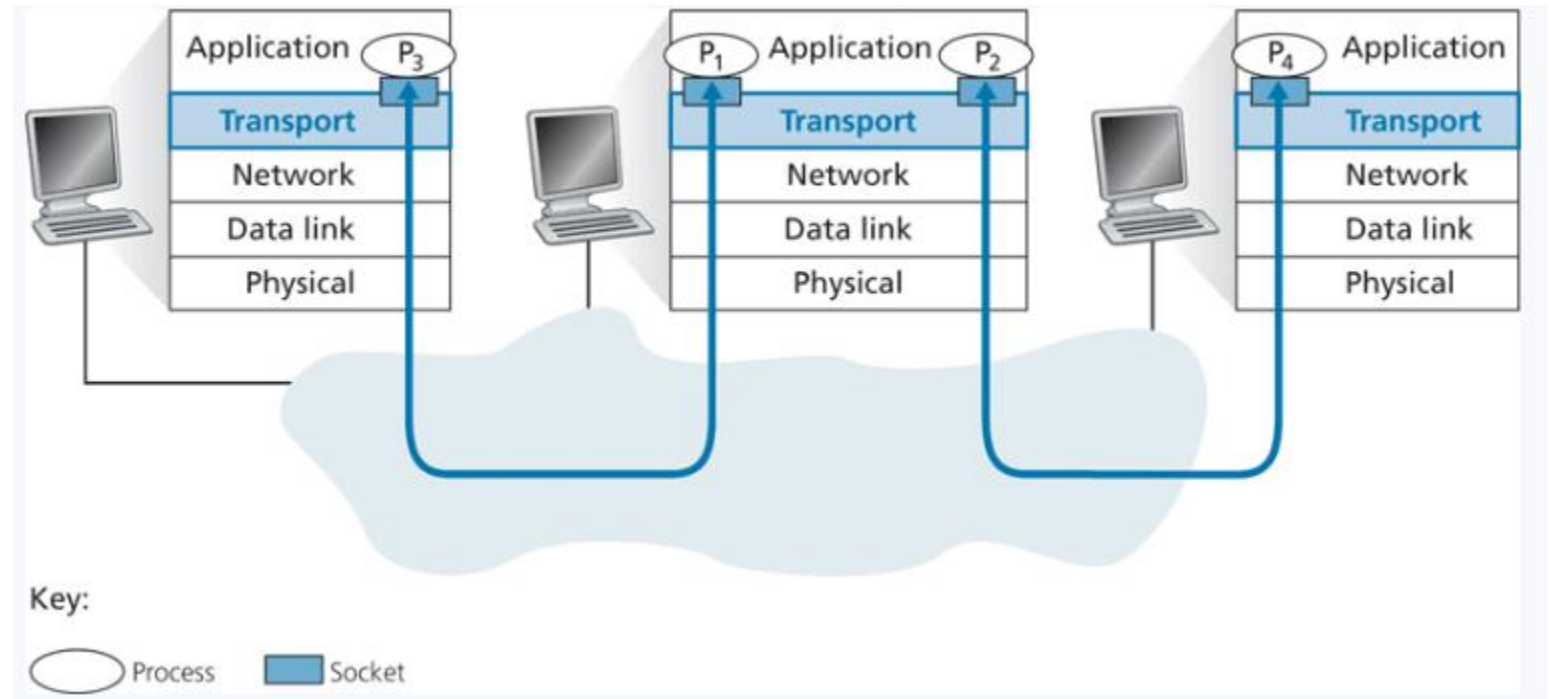

Transport Layer

TCP – Reliable, Connection-oriented transport layer protocol

UDP – Unreliable, connectionless transport layer protocol

Transport layer delivers to **sockets**

Transport Layer

TCP – Reliable, Connection-oriented transport layer protocol

UDP – Unreliable, connectionless transport layer protocol

Transport layer delivers to **sockets**

Messages from the Application Layer/Session Layer are split into smaller chunks called **segments**, and passed into the network layer

Transport Layer

TCP – Reliable, Connection-oriented transport layer protocol

UDP – Unreliable, connectionless transport layer protocol

Transport layer delivers to **sockets**

Messages from the network layer arrive as segments. Transport layer must reassemble to send it to the correct process

Transport Layer

TCP – Reliable, Connection-oriented transport layer protocol

UDP – Unreliable, connectionless transport layer protocol

Multiplexing is the process of gathering chunks from sockets, encapsulating chunks with header information, and passing the segment into the network layer

Transport Layer

TCP – Reliable, Connection-oriented transport layer protocol

UDP – Unreliable, connectionless transport layer protocol

Demultiplexing is the receiving segments from the transport layer and delivering the segment to the correct socket.

Transport Layer

TCP – Reliable, Connection-oriented transport layer protocol

UDP – Unreliable, connectionless transport layer protocol

A **port** is a 16-bit number that is an entrance/exit point of a machine

An active port is associated with a specific process or service

Network Layer

Transport Layer

TCP – Reliable, Connection-oriented transport layer protocol

UDP – Unreliable, connectionless transport layer protocol

Port	Request type
7	ECHO
20	FTP -- Data
21	FTP -- Control
22	SSH Remote Login Protocol
23	Telnet
25	Simple Mail Transfer Protocol (SMTP)
37	Time
53	Domain Name System (DNS)
69	Trivial File Transfer Protocol (TFTP)
79	Finger
80	HTTP
110	POP3
115	Simple File Transfer Protocol (SFTP)
137	NetBIOS Name Service
139	NetBIOS Datagram Service
143	Interim Mail Access Protocol (IMAP)
156	SQL Server
161	SNMP
194	Internet Relay Chat (IRC)
389	Lightweight Directory Access Protocol (LDAP)
443	HTTPS
445	Microsoft-DS
458	Apple QuickTime
546	DHCP Client
547	DHCP Server

Ones you should probably remember

- HTTP: 80
- HTTPS: 443
- DNS: 53
- SSH: 22
- FTP: 20/21
- SMTP: 25

You can request to register a service under a specific port number through the Internet Assigned Numbers Authority (**IANA**)

Transport Layer

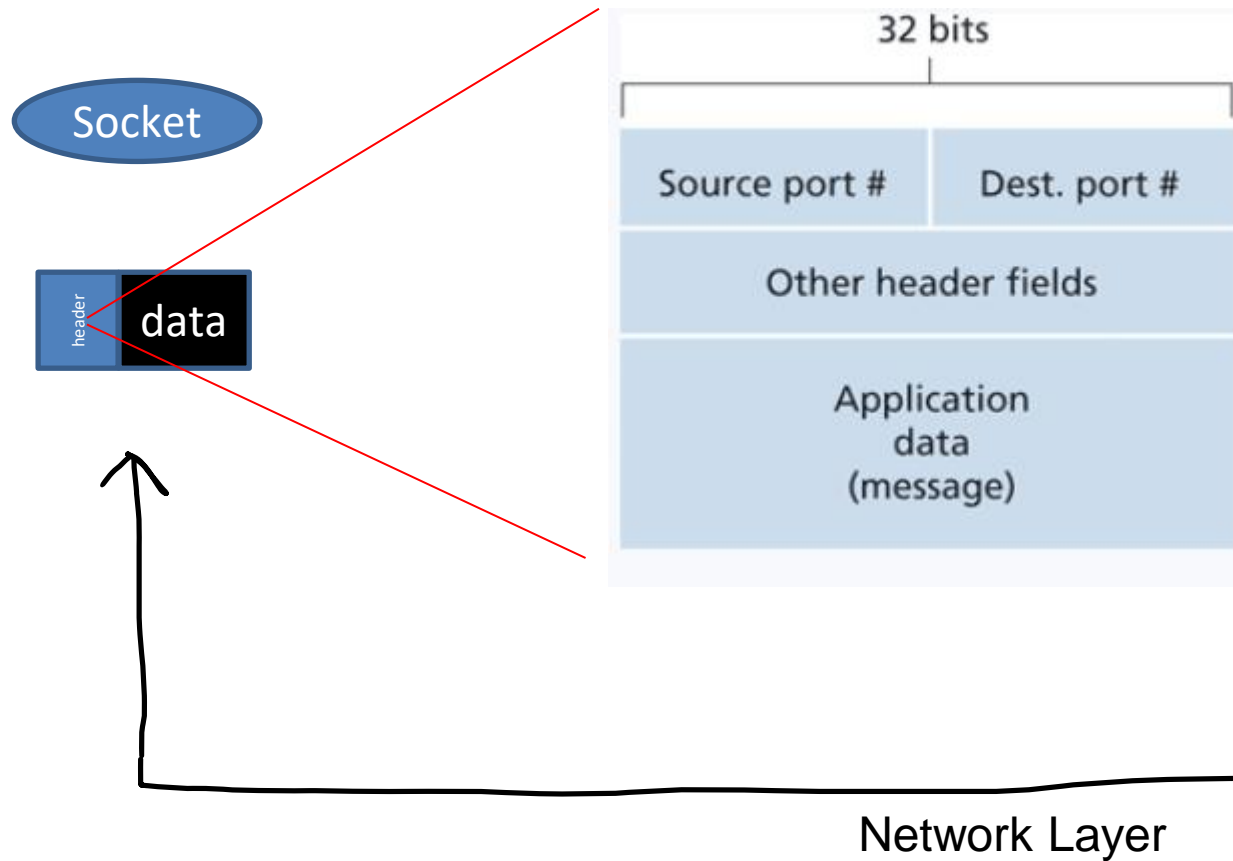

TCP – Reliable, Connection-oriented transport layer protocol

UDP – Unreliable, connectionless transport layer protocol

A **port** is a 16-bit number that is an entrance/exit point of a machine

An active port is associated with a specific process or service

When developing a new application, we need to assign the application a port number (greater than 1024)

Network Layer

```
clientSocket.bind('', 19157))
```

```
clientSocket = socket(AF_INET, SOCK_DGRAM)
```

Transport Layer

TCP – Reliable, Connection-oriented transport layer protocol

UDP – Unreliable, connectionless transport layer protocol

A **port** is a 16-bit number that is an entrance/exit point of a machine

An active port is associated with a specific process or service

Why does UDP need a source port # ?

Network Layer

Transport Layer

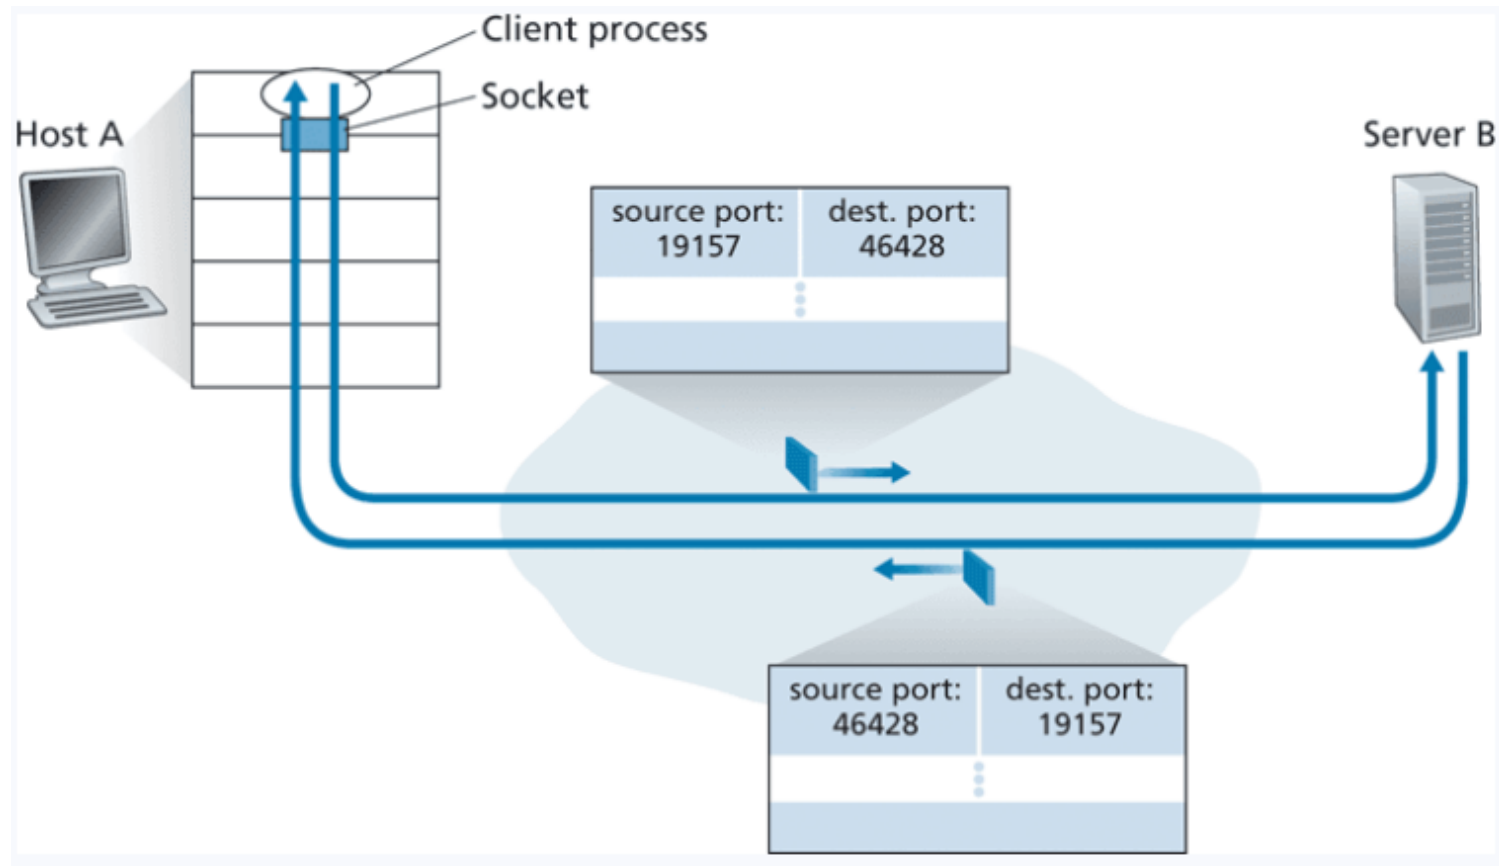

Multiplexing is the process of gathering chunks from sockets, encapsulating chunks with header information, and passing the segment into the network layer

Demultiplexing is the receiving segments from the transport layer and delivering the segment to the correct socket.

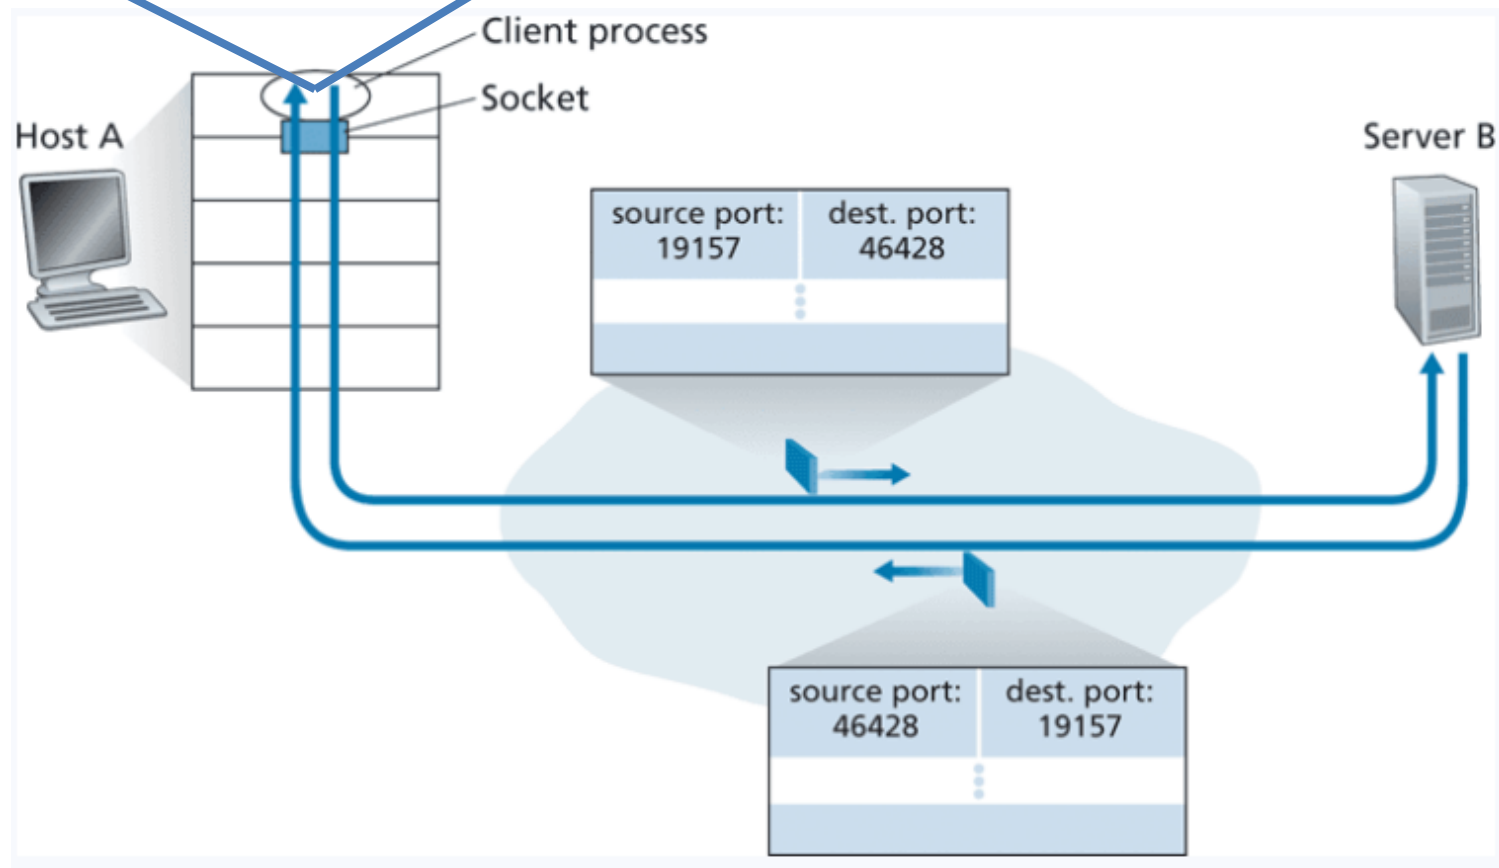

Transport Layer

Transport Layer

UDP sockets are identified by a two-tuple

(destination IP address, destination port number)

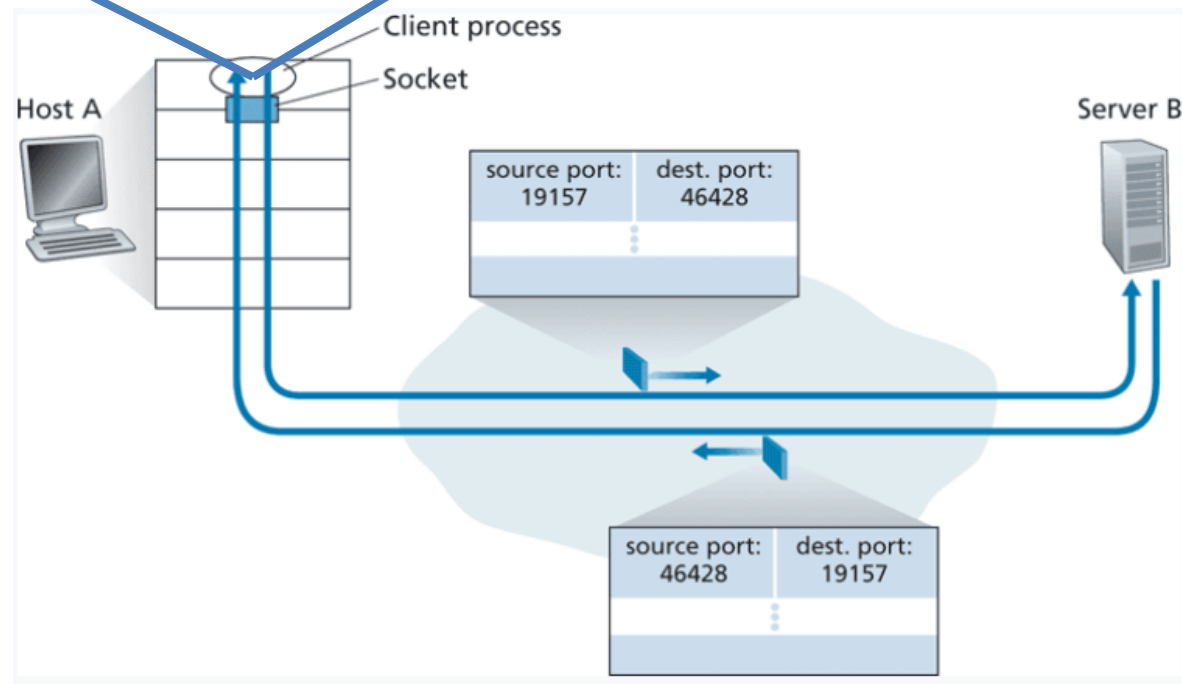

Transport Layer

TCP sockets are identified by a four-tuple

A host will demultiplex segments using all of these values

(source IP address, source port number, destination IP address, destination port number)

Transport Layer

The receiver will do that for each packet, if the checksum is invalid, it may ask for a retransmission

Transport Layer

Why do error checking here?

Protocols at other layers (link layer) can also do error checking

Transport Layer

Why do error checking here?

Protocols at other layers (link layer) can also do error checking

However, there is no guarantee that our packet of information will use these protocols

Transport Layer

Why do error checking here?

Protocols at other layers (link layer) can also do error checking

However, there is no guarantee that our packet of information will use these protocols

End-to-end principle states that since certain functionality such as error detection, must be implemented on an end-end bases

Functionality places at the lower levels may be redundant or of little value when compared to the cost of providing them at a higher level
